

## Spotifam Installation/User Guide

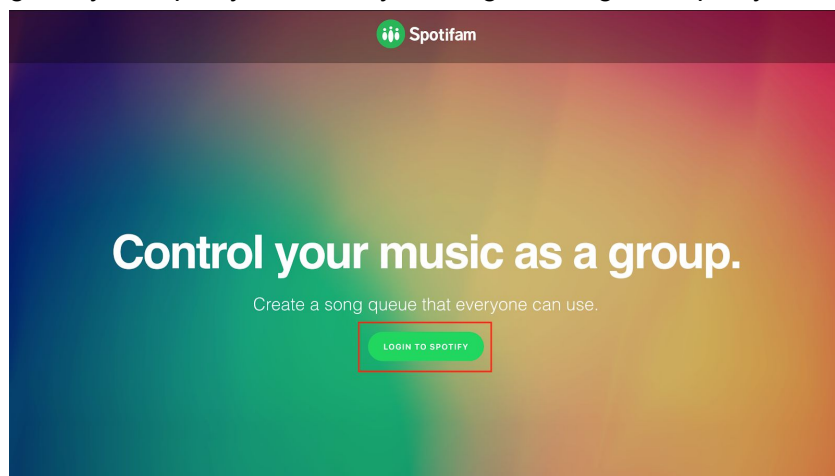

### Installation

1. Download spotifam-webapp repo
2. Navigate to the frontend folder
3. Run the following commands:
  - a. Run `npm install` to download the current node\_modules
  - b. Run `npm start`. This will open the website on your localhost:3000
  - c. When you go through the below user guide and arrive at step 2, replace the "<https://www.spotifam.com/>" part of the link with "localhost:3000" to run Spotifam locally on your machine.

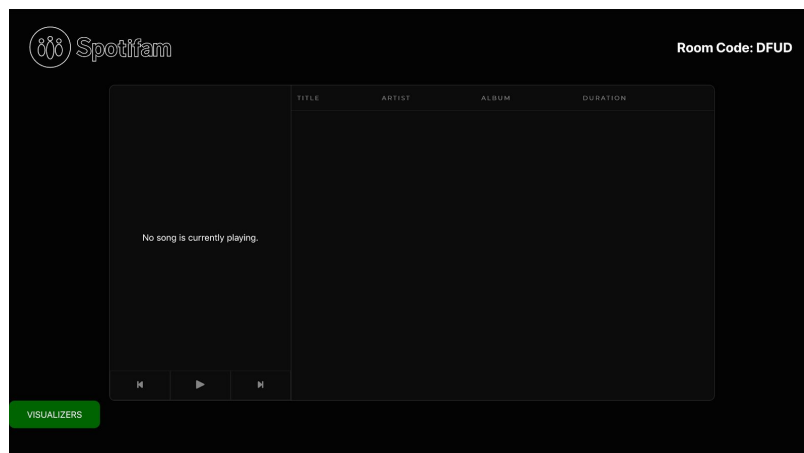

Alternatively, since our program is hosted online, you can go to [www.spotifam.com](https://www.spotifam.com) to also use our program.

### User Guide

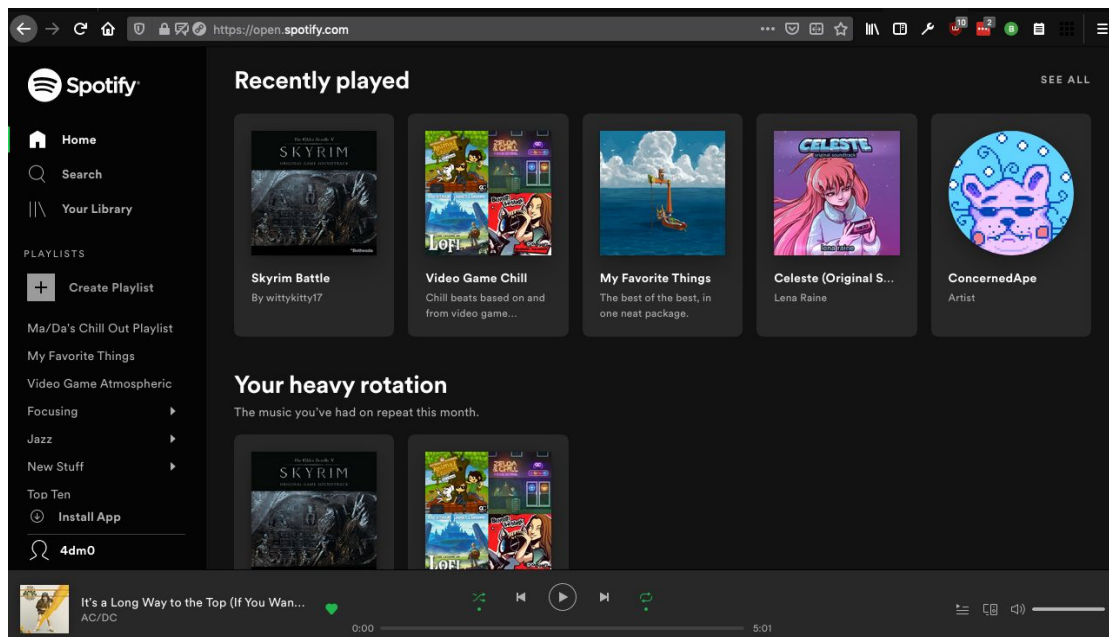

1. Login to your Spotify account by clicking the "Login to Spotify" button.

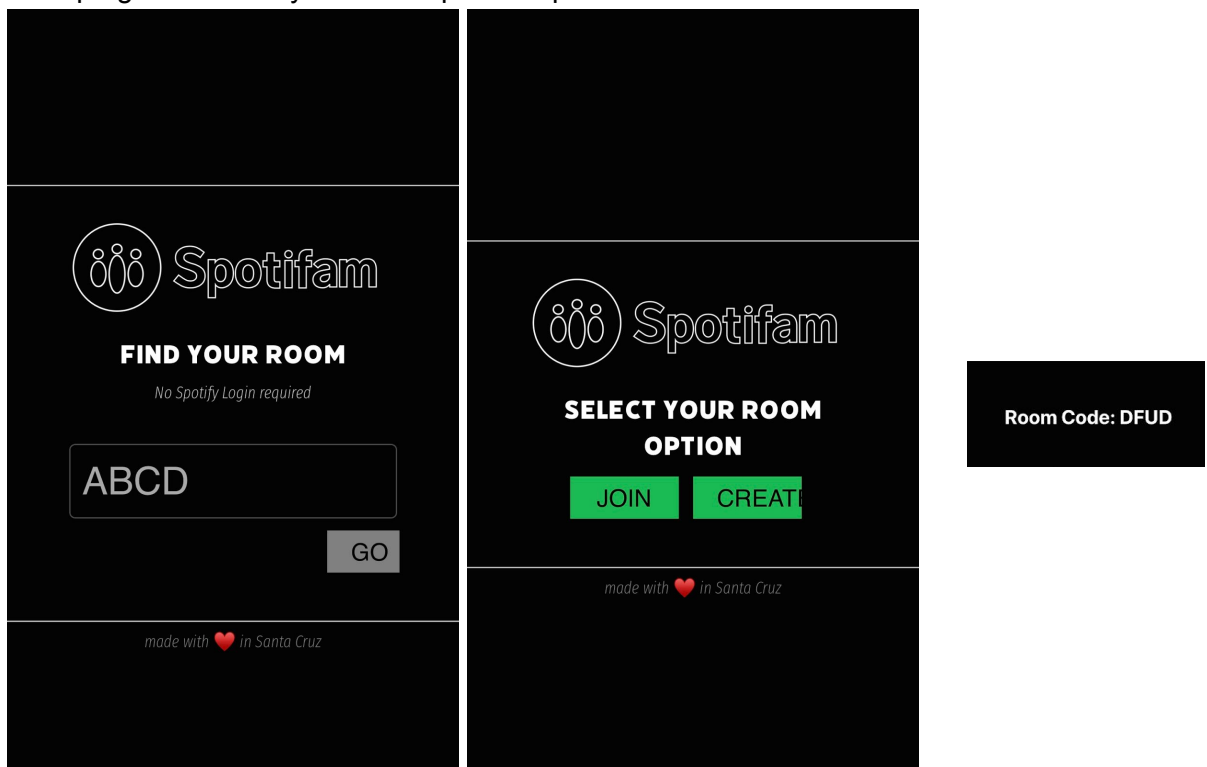

2. After logging into Spotify with your Spotify account, you will be brought to the Spotify web player.

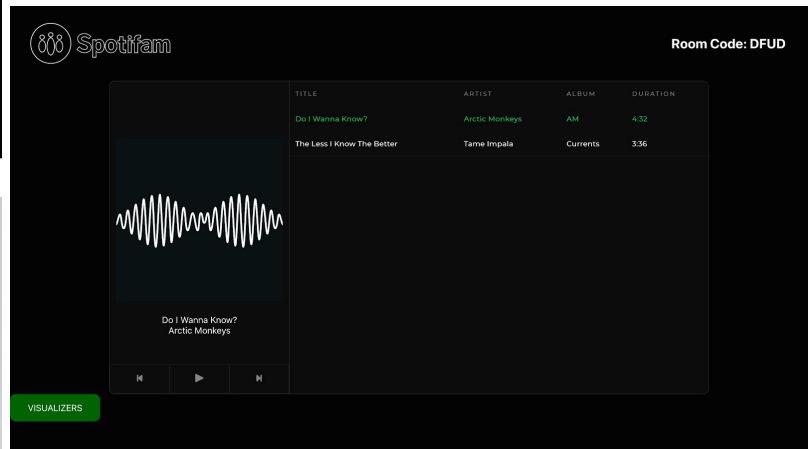

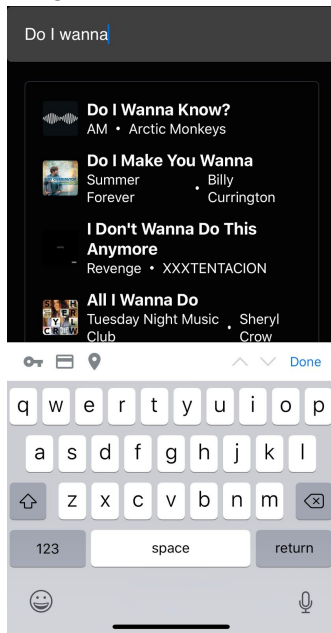

3. Create an instance of Spotify outside of Spotifam. What this means is that you will have to open either the Spotify web player ([www.open.spotify.com](https://open.spotify.com)) or the Spotify desktop application.

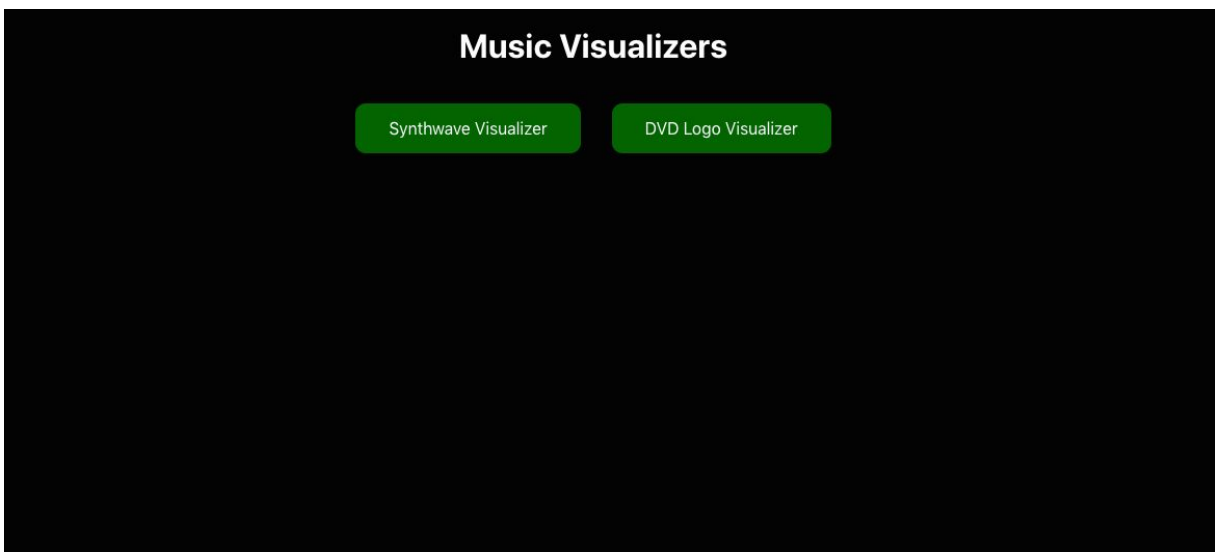

4. Go to [www.spotifam.com](http://www.spotifam.com) on your mobile phone, or open [www.spotifam.com](http://www.spotifam.com) in a separate web browser window and shrink the window to mobile phone dimensions. Then, in that instance of [ww.spotifam.com](http://www.spotifam.com), click join and enter the room code that's in the top right corner of your desktop [www.spotifam.com](http://www.spotifam.com) instance.

5. Search for songs in the mobile version of Spotifam, and click on songs to add them to the queue of songs to play. You can then pause, skip the song, and go back a song/start song from the beginning via the controls in the desktop Spotifam instance under the song album art and text.

6. You can click on the “Visualizers” Button in the bottom left to get a selection of two visualizers, a “DVD Logo” visualizer and a “Synthwave” visualizer. You can have these running while your songs play. You can still add songs to the queue via your phone while these visualizers play.
